# How does UTW work?

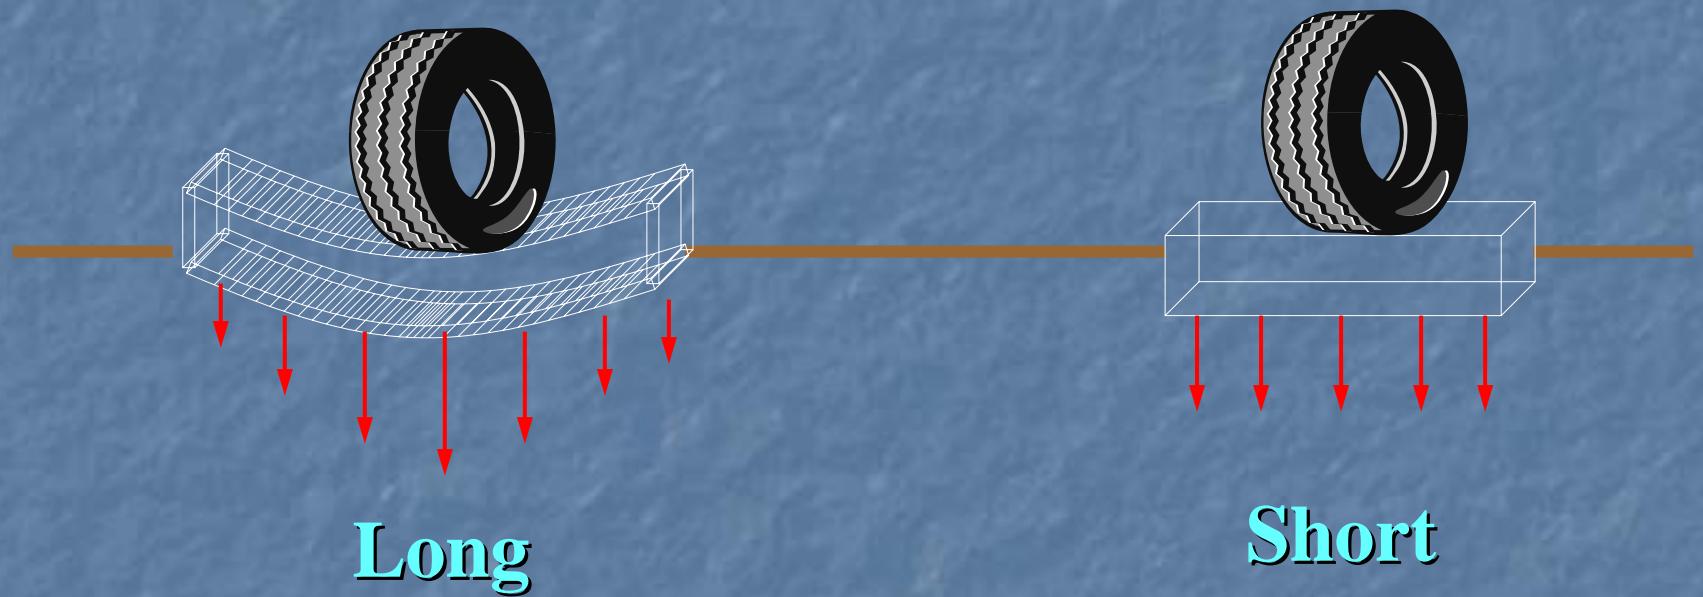

**Bonded**

**Unbonded**

# How does UTW work?

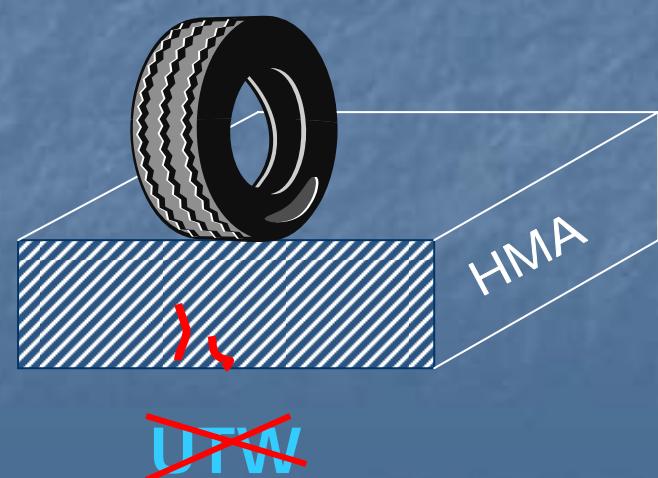

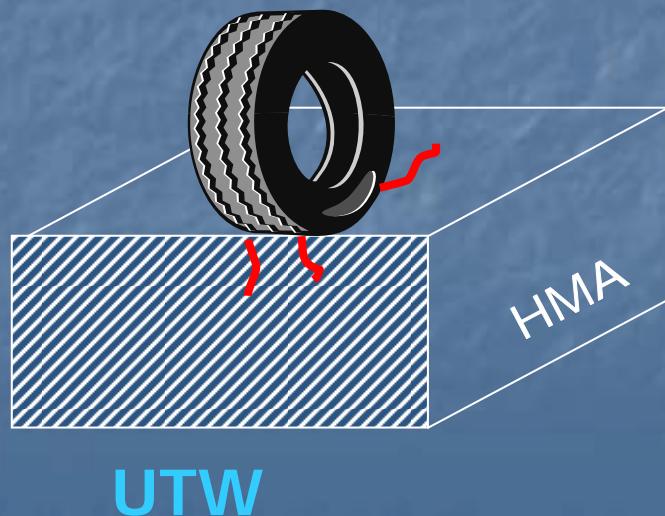

Long

Short

Joint Spacing

# When to consider UTW

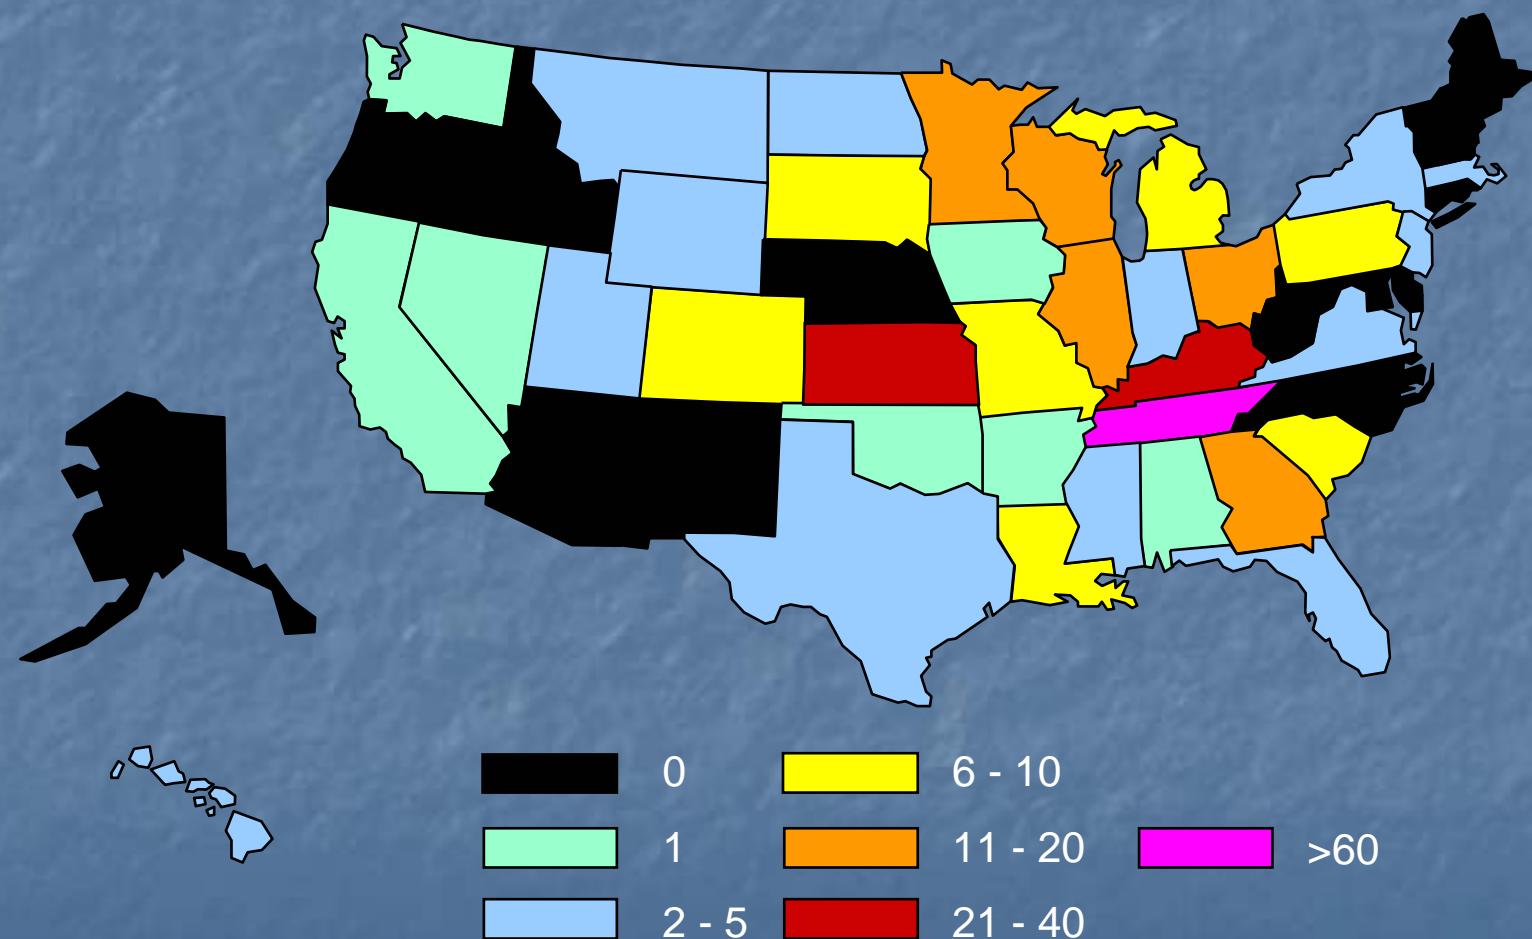

- ⇒ HMA thickness  $\geq$  75 mm
- ⇒ No stripping/raveling
- ⇒ No excessive bottom-up fatigue cracking

# Keys to UTW Performance

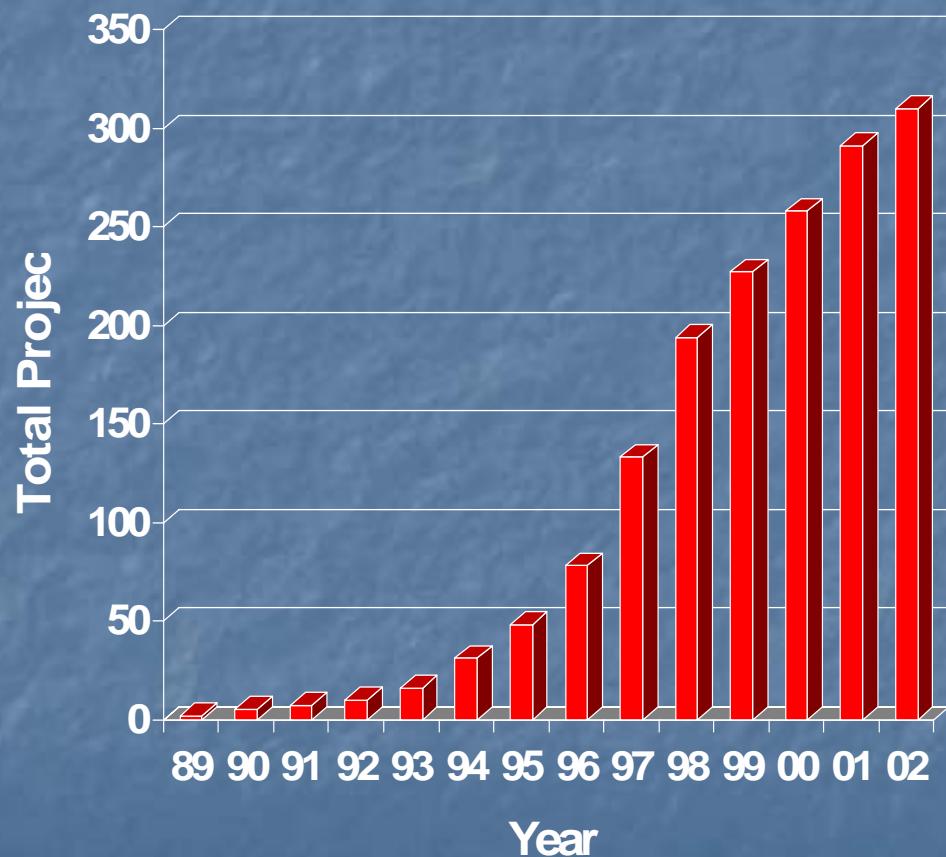

- Adequate (HMA and soil) support layers
- PCC-HMA bond (**essential**)
- Slab size / joint spacing
- Concrete material selection
- Design Inputs
  - Traffic, layer thickness, climate, etc.

# UTW Use by State - 2002

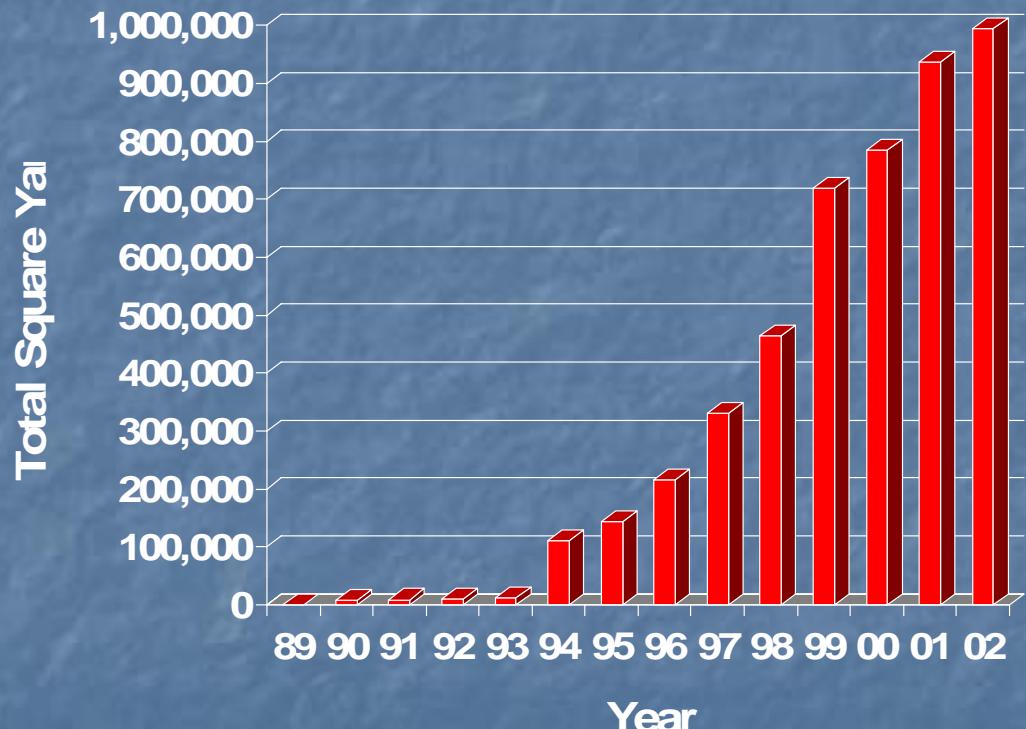

# Ultra-Thin Whitetopping

Since 1990, over  
300 UTW projects  
have been  
constructed

# Ultra-Thin Whitetopping

Since 1990 about 1 million SY placed – It is not experimental anymore

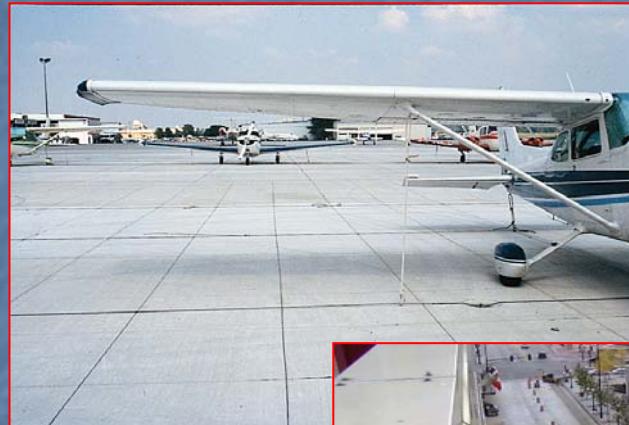

Over 835,000 m<sup>2</sup>

# Appropriate applications

# Applications for UTW

- Streets
- Intersections
- Bus pads
- GA airports
- Parking lots

# Stopping Areas...

Jerry Voight - ACPA

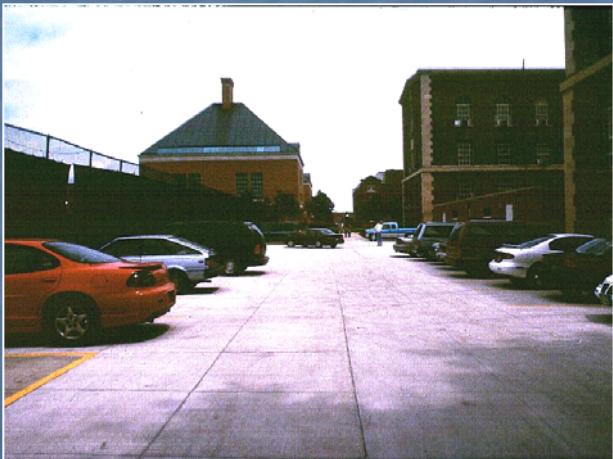

# Chicago Bus Stops

- Building more than 1000 concrete bus stops (approximately 30 x 3 m)
- Cobblestone/asphalt base costly to remove
- Thickness constrained from 90 to 140 mm
- Increase strength
- Use structural fibers

# UTW Commercial Projects

Randy Riley: ACPA - IL Chapter

# Lancaster, PA

## Rt 30 & 896

Lancaster, PA  
Rt 30 & 896

R. Riley

# Whitetopping - Advantages

## Structural

- Improved structural capacity
- Low maintenance
- Reacts structurally as if on strong base course
- Concrete slabs bridge problems asphalt cannot

Randy Riley

# Whitetopping - Advantages

## Construction

- Can place on pavement in poor condition.
  - Little or no pre-overlay repair needed.
- Avoid reconstruction problems.
  - Minimal rain delays.
  - Maintain traffic on existing surface.

Randy Riley

# Whitetopping - Advantages

Safer

- Visibility
- Decreased stopping distances
- Non-rutting
- Less work zone reconstruction
- *less accidents*

# Performance after 4 years

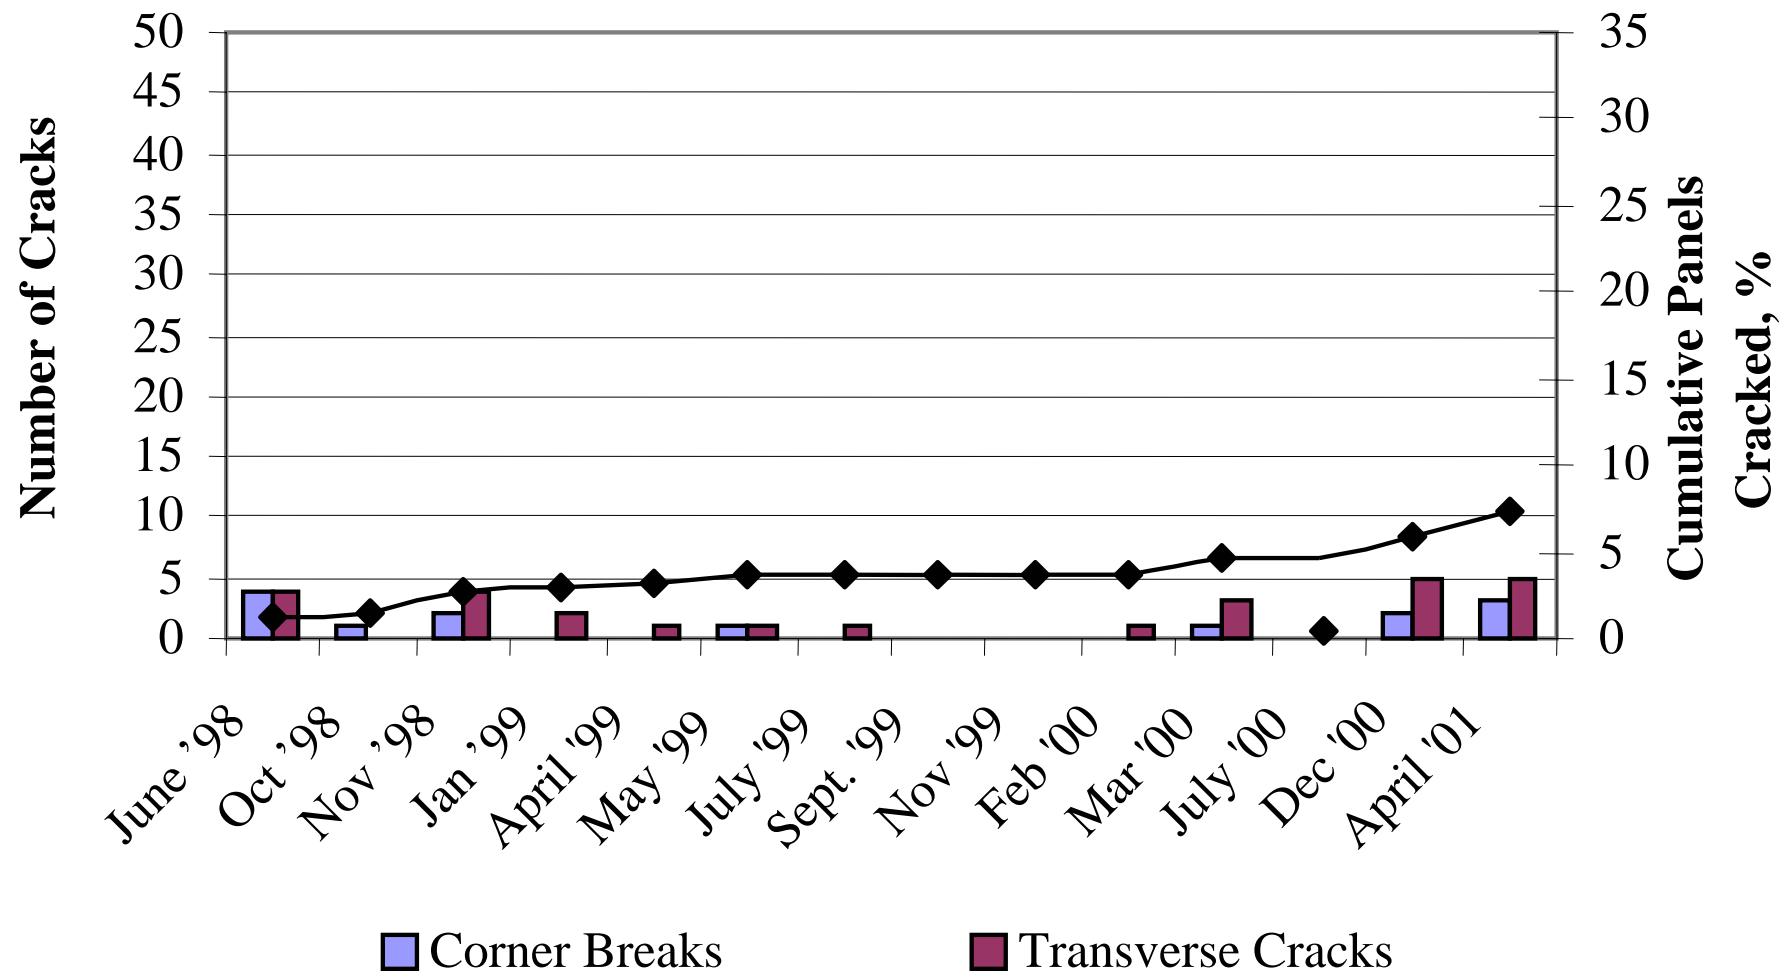

Interstate highway with 25,000 ADT, 12-13% trucks

## 76 mm - 1.2 m x 1.2 m Panels

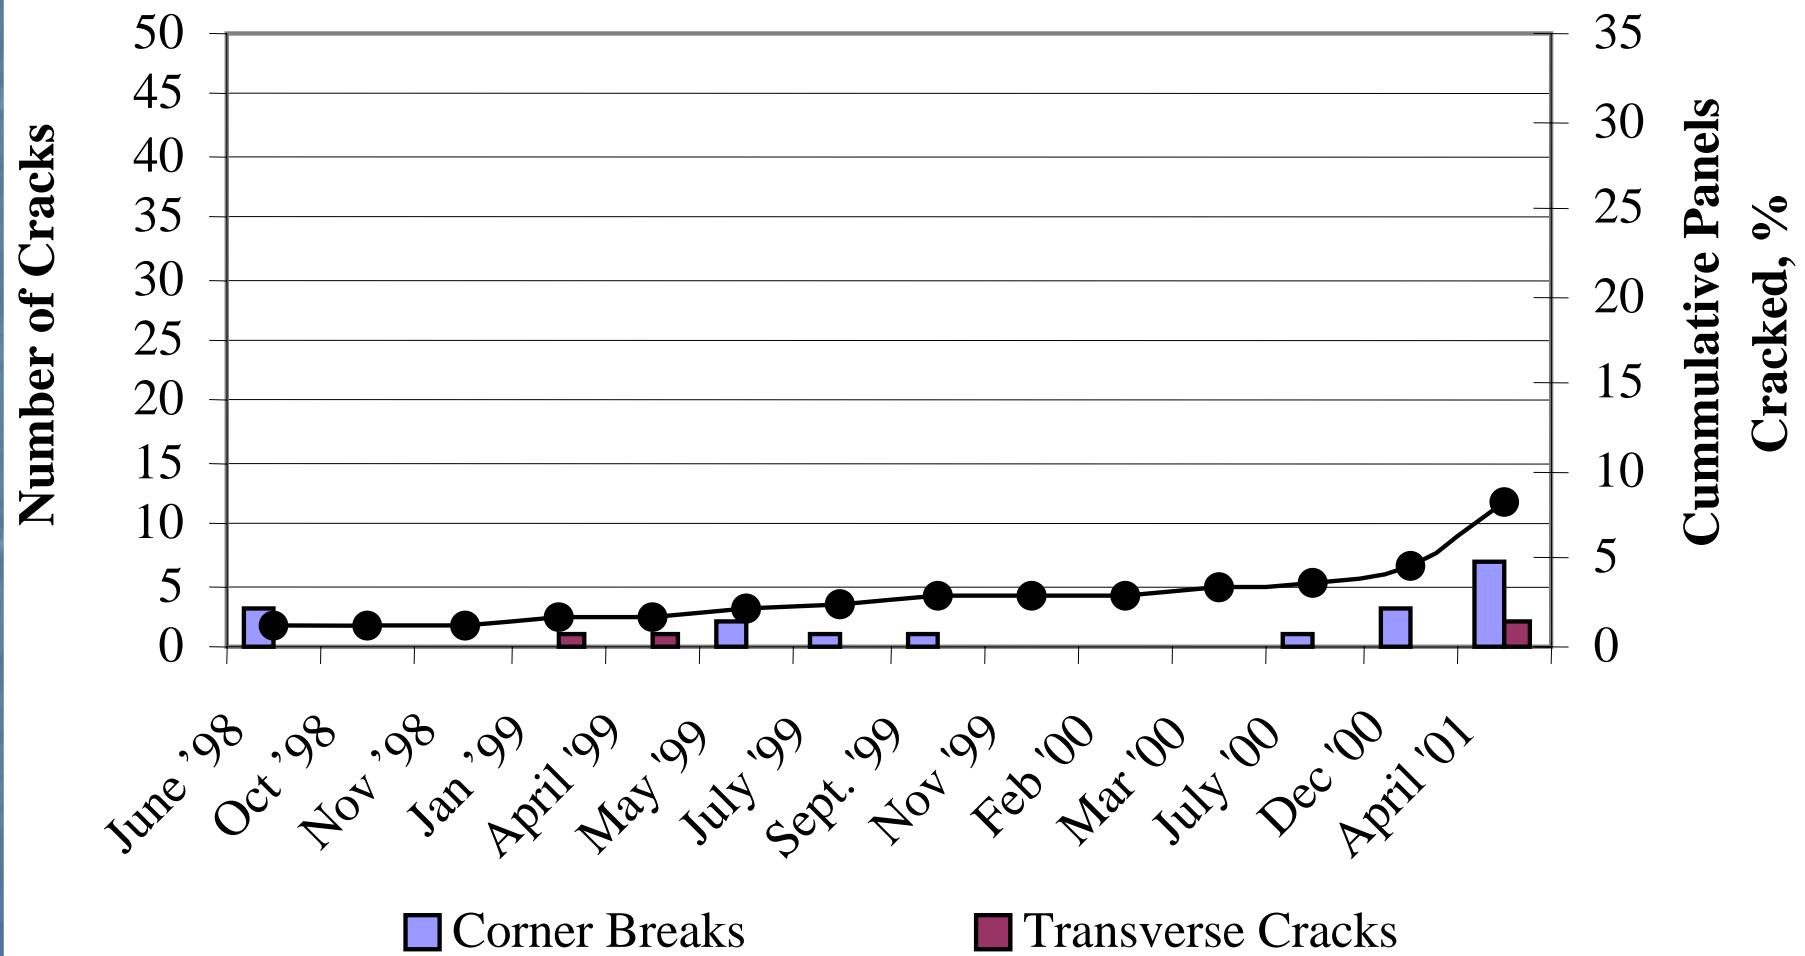

83 % of the distress occurred in the driving lane.

## 102 mm - 1.2 m x 1.2 m Panels

73 % of the distress occurred in the driving lane.

## 76 mm - 1.5 m x 1.8 m Panels

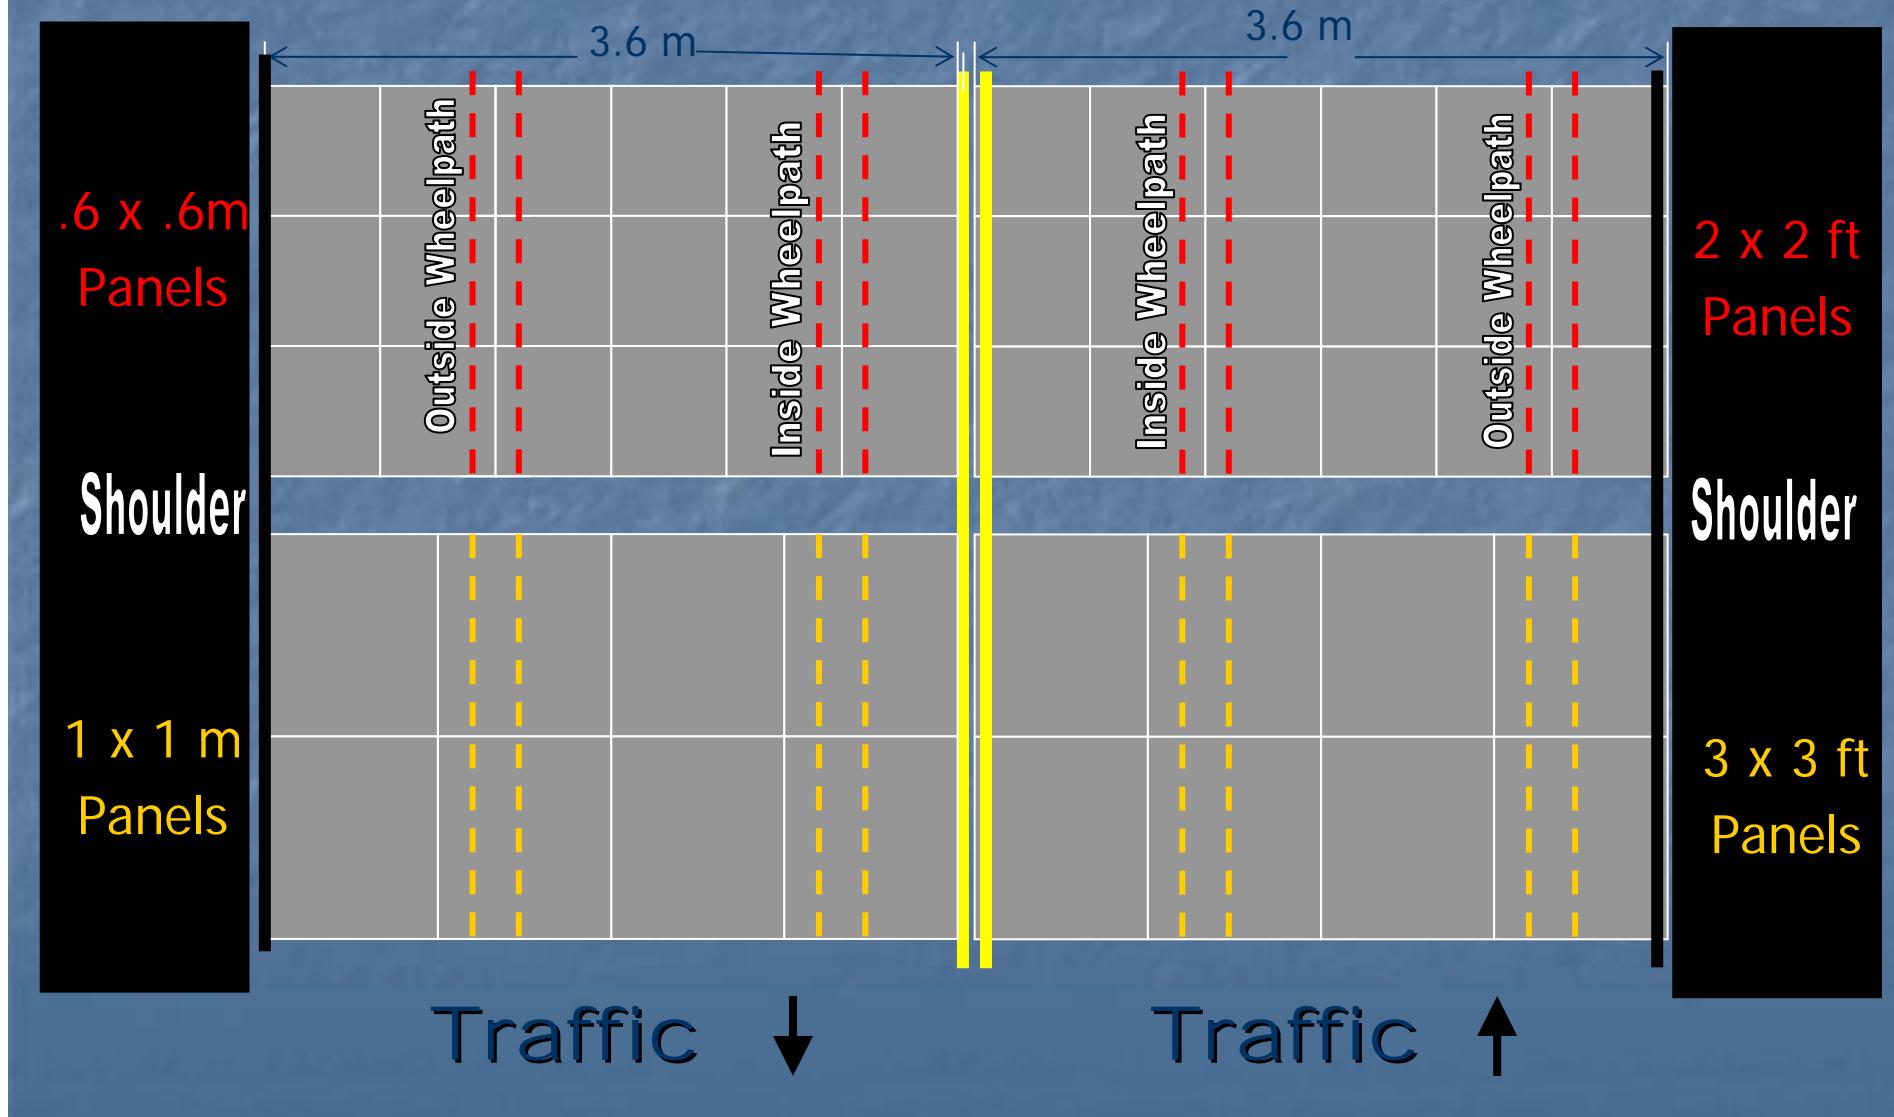

75 % of the distress occurred in the driving lane.

# Whitetopping Crack Summary

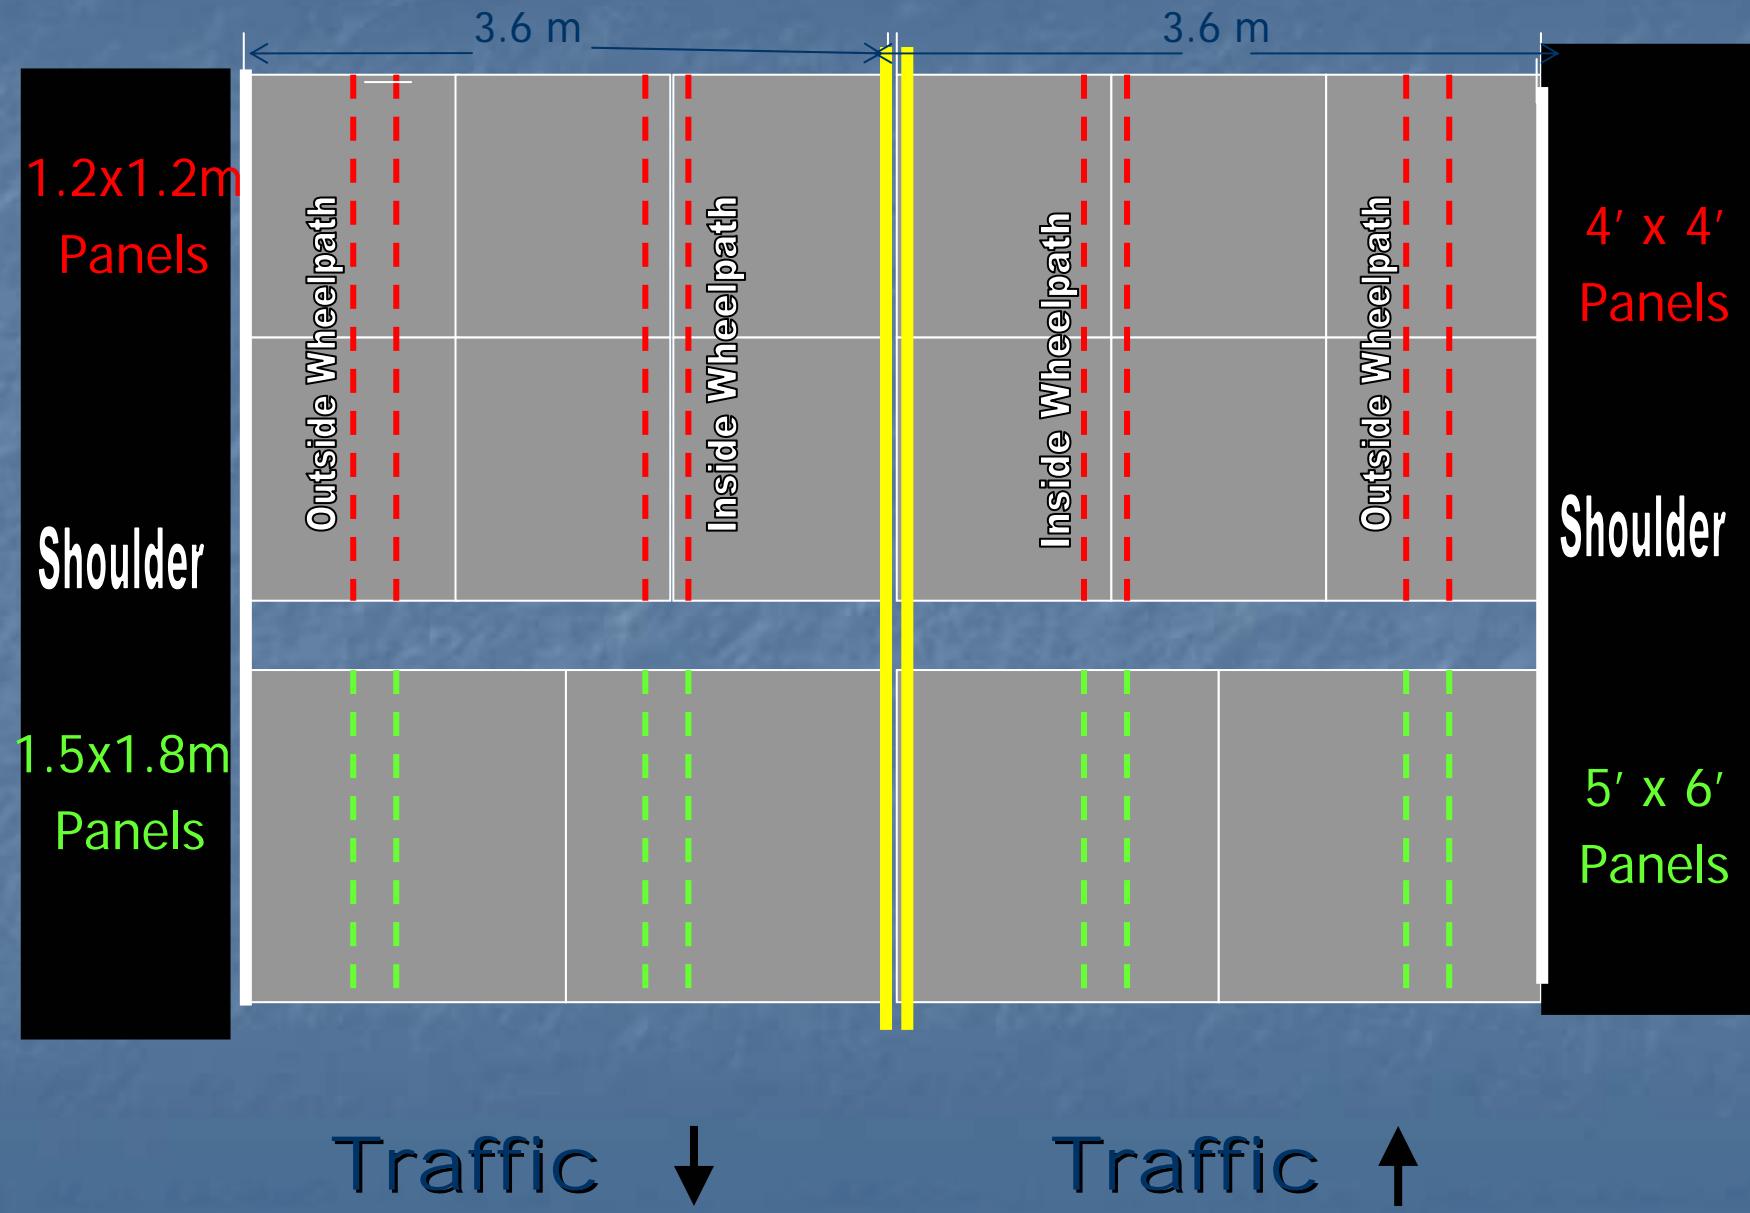

| Cell                 | Panels Cracked (%) | Corner Cracks | Trans. Cracks | Long. Cracks |
|----------------------|--------------------|---------------|---------------|--------------|
| 102- 1.2x1.2m        | 7                  | 14            | 27            | 0            |
| 76- 1.2x1.2m         | 40                 | 165           | 19            | 0            |
| 76- 1.2x1.2m *       | 8                  | 18            | 4             | 0            |
| <b>152- 1.2x1.2m</b> | <b>0</b>           | <b>0</b>      | <b>0</b>      | <b>0</b>     |

\*All transverse cracks in 78 mm 1.2 x 1.2m section are reflective cracks.

# Longitudinal Joint Layout

# Temperature and applied load

40 kN FWD load in wheelpath for 76 mm 1.52-m x 1.83-m panels

# ISLAB 2000 FEM

## Principal Stresses

**Modeling Assumptions:**

- 76-mm 1.2 x 1.2m Panels
- Fully bonded
- 0.80 °C/cm gradient
- 356 kN Tandem axle load

1. HMA temp. greatly influences stress (strains)
2. Temperature gradients have little influence on stress (strains)

# Lessons learned ?

- Must obtain a good bond
- Initial condition of existing HMA
- HMA layer must have adequate structure
- Evaluate original structure (depth of HMA layers, condition of HMA...)
- Fibers help keep cracks tight
- Joint layout

# Designing UTW

# UTW Design

## Joint Spacing

1. 12 to 18 times pavement thickness
2. Keep longitudinal joints out of wheelpath

# UTW Design

Concrete mixture design.....

- Typical Higher Cement Content
  - Fast track type construction
- Low Water / Cement Ratio
- Synthetic Fibers
- Durable, Quick Opening to Traffic

# Macro vs Micro Fibers

## Macro-Fibers

**Diameters:** 0.2 to 0.8 mm  
(0.008 - 0.03")

**Materials:** Steel, Synthetic

## Micro-Fibers

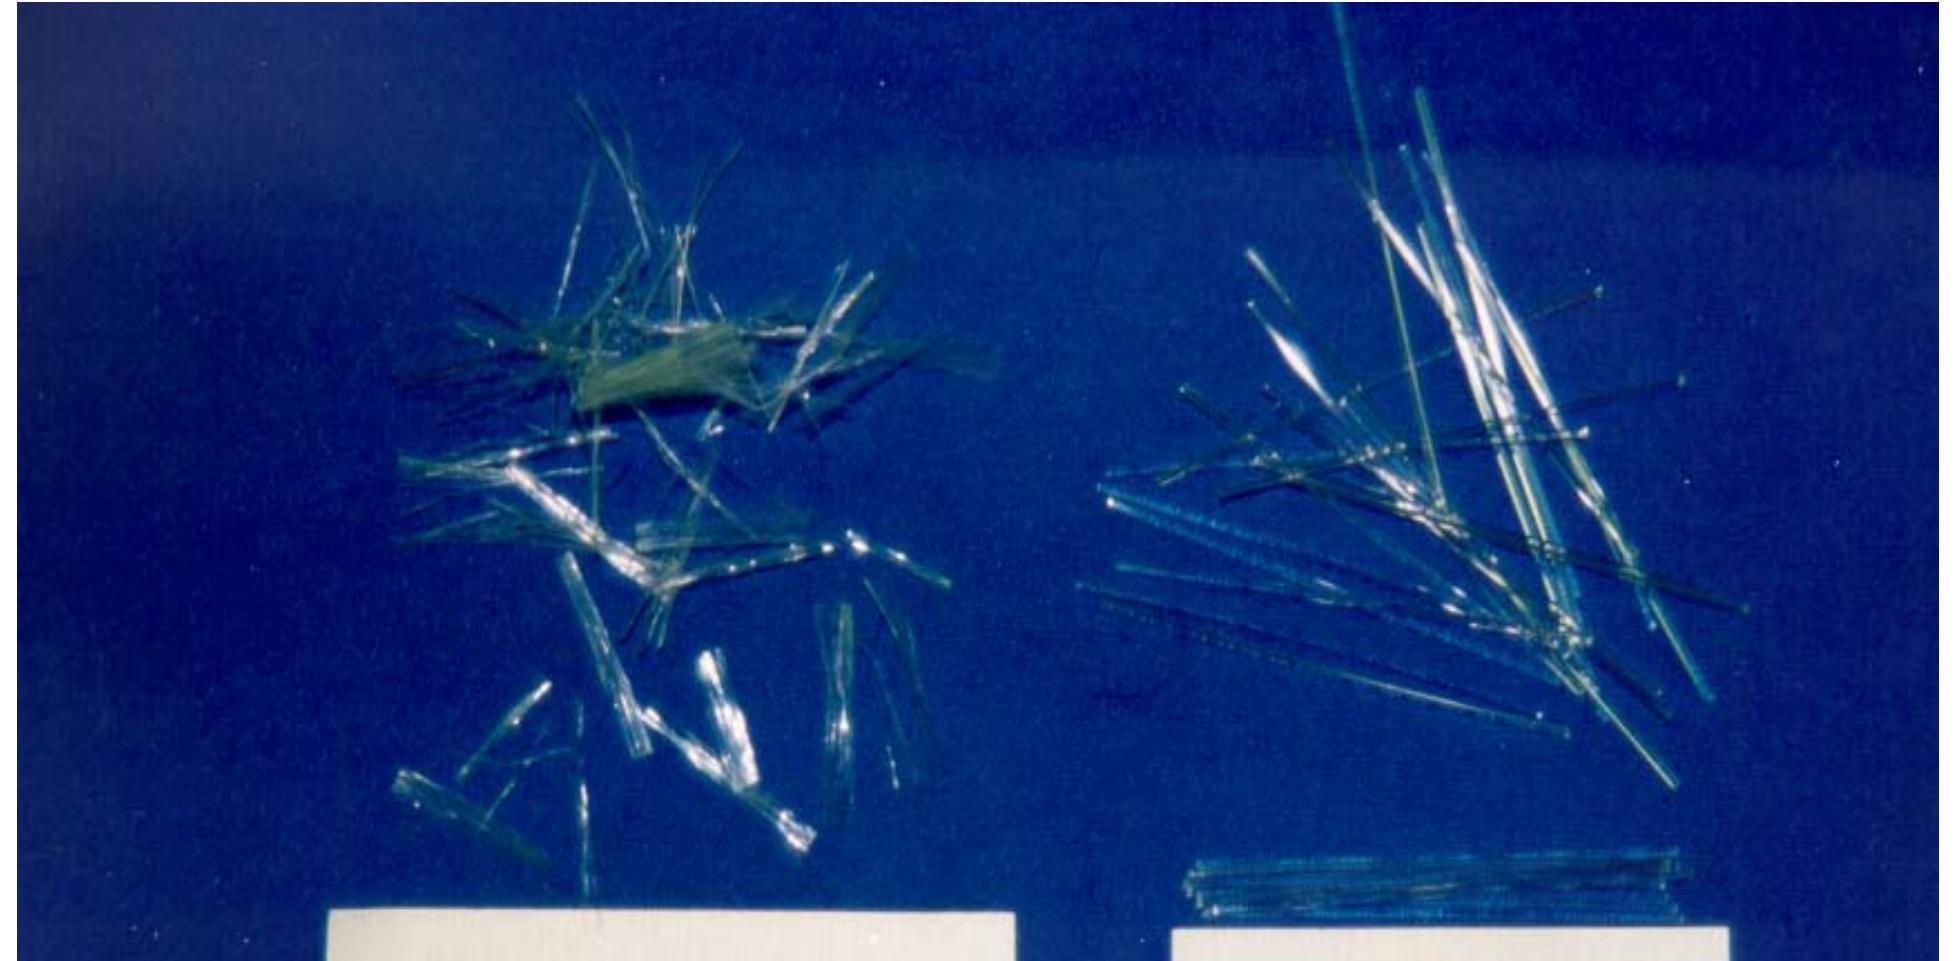

**Diameters:** < 0.1 mm  
(< 0.004")

**Materials:** Polypropylene,  
Steel, Carbon, ...

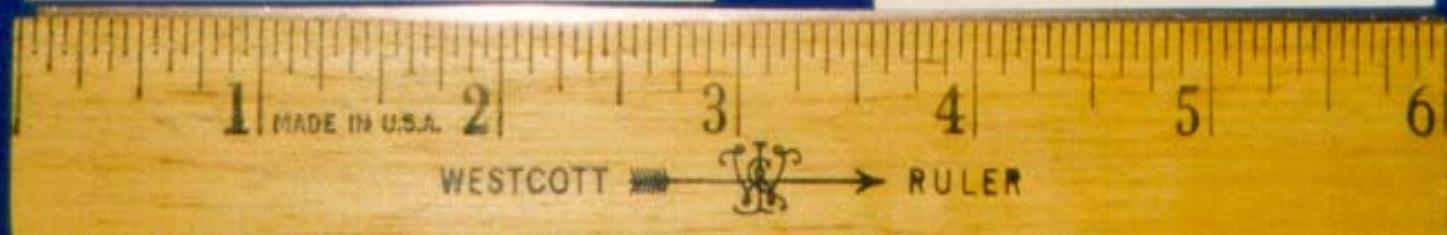

Typically a 20% increase in the cost of the mix.

# UTW Design

HMA condition assessment ..

- Values chosen for design:

- Poor ( $E_{AC} = 700 \text{ MPa}$ )
  - fatigue cracked, old
- Fair ( $E_{AC} = 2,500 \text{ MPa}$ ) 
- Good ( $E_{AC} = 4,000 \text{ MPa}$ )
  - rutting, no structural damage

# UTW Design Equations

Effective radius of relative stiffness...

$$l_e = \left( \frac{I_e}{(1 - 0.15^2) * k} \right)^{0.25}$$

$$NA = \frac{\frac{(E_c t_{PCC})^2}{2} + E_b t_{BIT} \left( t_{PCC} + \frac{t_{BIT}}{2} \right)}{E_c t_{PCC} + E_b t_{BIT}}$$

$$I_e = (Eh^3/12)e = \frac{(E_c t_{PCC})^3}{12} + E_c t_{PCC} \left( NA - \frac{t_{PCC}}{2} \right)^2 + \frac{(E_b t_{BIT})^3}{12} + E_b t_{BIT} \left( t_{PCC} - NA + \frac{t_{BIT}}{2} \right)^2$$

# UTW Design Equations

Determining total stress...

$$\log(\sigma_{18}) = 5.025 - 0.465 \log(k) + 0.686 \log(L/l_e) - 1.291 \log(l_e)$$

Based on 2-D Finite element with 36% stress increase (partial bond)

$$\sigma_T = 28.037 - 3.496(CTE * \Delta T) - 18.382(L/l_e)$$

$$\sigma_{\text{Total}} = \sigma_{18} + \sigma_T$$

Superposition assumes slab and HMA remain in contact

# UTW Design Equations

PCC strength characterization...

ASTM C1609-07

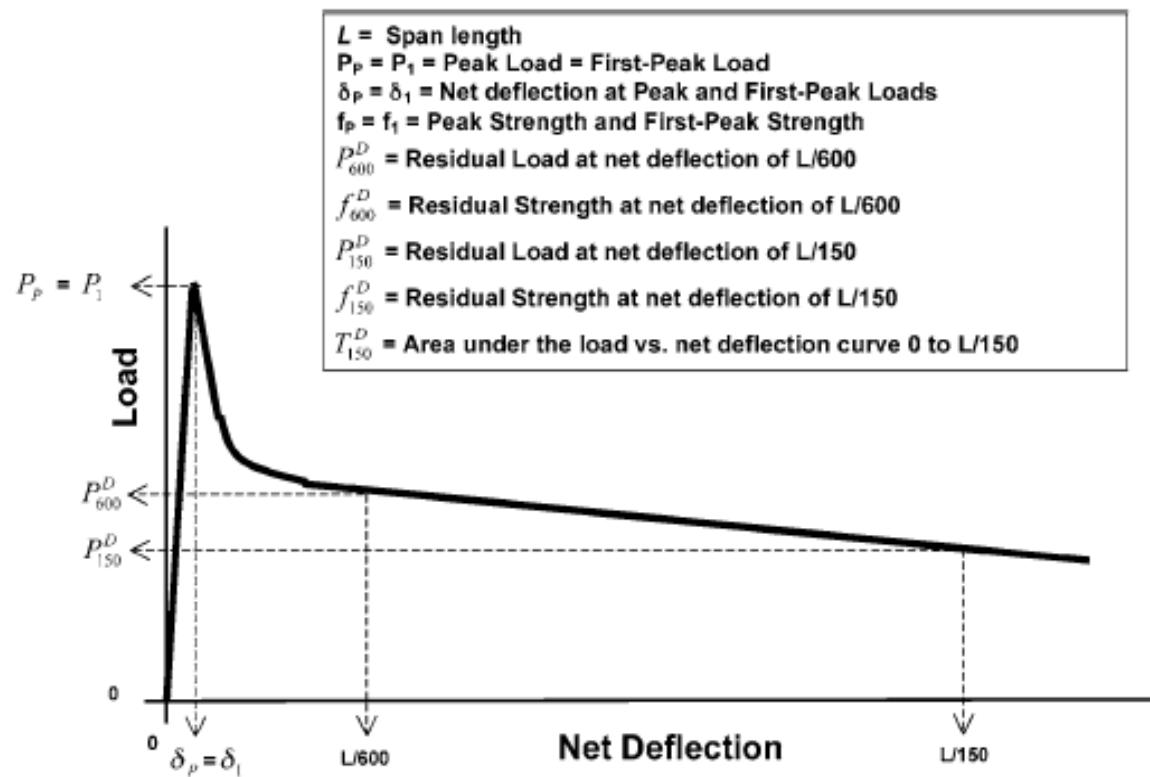

FIG. 3 Example of Parameter Calculations for First-Peak Load Equal to Peak Load (Not to Scale)

**Beams:**  
150x150x530mm  
Span: 450mm  
 $L/150 = 3$  mm

$$MOR = \frac{P_1 L}{bd^2}$$

$$f_{150}^{150} = \frac{P_{150}^{150} L}{bd^2}$$

$$R_{150}^{150} = \frac{f_{150}^{150}}{MOR} * 100$$

# UTW Design Equations

Stress Ratio...

$$R_{150}^{150} = \frac{f_{150}^{150}}{\text{MOR}} * 100 \quad (\text{ASTM C1609-07})$$

$R_{150}$  values = 20%

$$\text{Stress Ratio (SR)} = \frac{\sigma_{\text{Total}}}{(1+R_{150}) * \text{MOR}}$$

# UTW Design Equations

Fatigue ...

$$R^* = 1 - \frac{(1 - R) * P_{cr}}{0.5}$$

$$\log N_{PCC} = \left[ -\frac{SR_{total}^{-10.24} \log(R^*)}{0.0112} \right]^{0.217}$$

# UTW Design Procedure

The screenshot shows a Microsoft Internet Explorer window displaying the "Pavement Technology - Technical - UTW Load Carrying Capacity Calculator" page from <http://www.pavement.com/pavtech/tech/utwcalc/main.asp>. The page is part of the American Concrete Pavement Association (ACPA) website.

The main content area is titled "Load-Carrying Capacity Calculator". It explains that the website calculates the load-carrying capacity of an ultra-thin whitetopping (UTW) pavement in terms of the total number of trucks that can be carried during its service life. The calculations are based on a comprehensive mechanistic analysis and correlation to UTW performance data. For more information, see ACPA publication IS100P - Ultra-thin Whitetopping.

The calculator interface includes the following input fields:

- Unit of Measure:** English (dropdown menu)
- Axle-Load Category:** Category A (dropdown menu)
- Portland Cement Concrete Inputs:**
  - Thickness (inches, mm): 2
  - Joint Spacing (feet, meters): 2
  - Flexural Strength (psi, MPa): 700
- Asphalt Concrete Inputs:**
  - Thickness (inches, mm): 3
- Other Inputs:**
  - k-value (pci, MPa/m): 100

A "Calculate Allowable Trucks Per Lane" button is located at the bottom of the input section.

At the bottom of the page, there is a note about the unit of measure and a link to return to the top.

<http://www.pavement.com/pavtech/tech/utwcalc/main.asp>

# UTW Design

- Traffic
  - Category A – Low truck volume
  - Category B – Medium truck volume
- *Average Flexural Strength*
  - Third-point loading (ASTM C78)
- Composite k-value of all layers below HMA

# UTW Design

- Composite k-value of all layers below HMA

| Subgrade  |                | Combined thickness of base and subbase, in. (mm) |          |          |
|-----------|----------------|--|----------|----------|
| Soil      | k, pci (MPa/m) | 4 (100)  | 8 (200)  | 12 (300) |
| Poor      | 75 (20)        | 90 (24)  | 120 (32) | 150 (41) |
| Fair      | 100 (27)       | 118 (32)   | 152 (41) | 186 (51) |
| Good      | 150 (41)       | 168 (46)   | 208 (56) | 250 (68) |
| Excellent | 200 (54)       | 217 (59)   | 260 (71) | 310 (84) |

# Construction

# UTW Construction

## ■ Milling

- Use when rutting > 25mm
- Removes between 25 and 76mm
  - Can shave off top of ruts

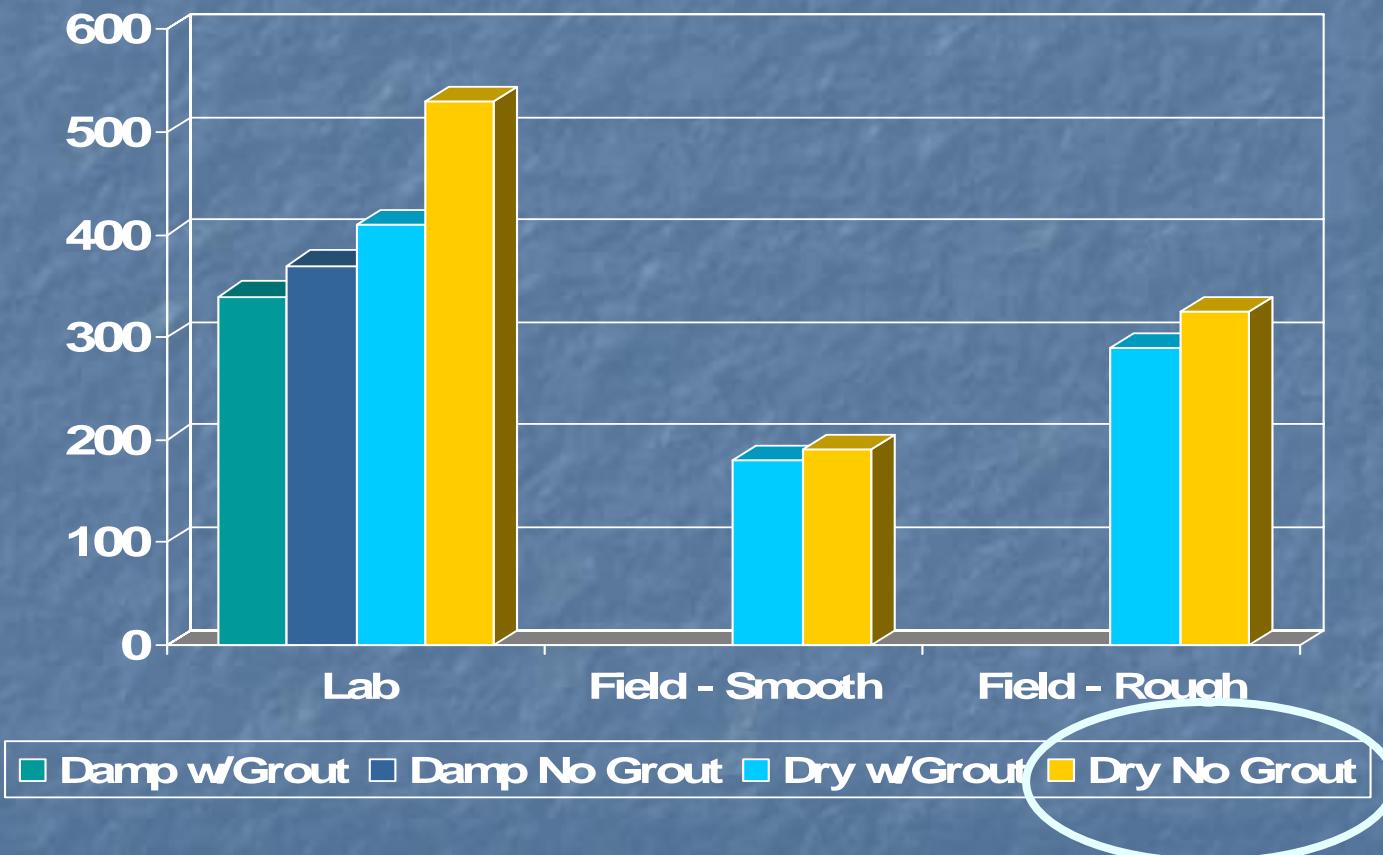

## ■ Used with inlays

- Limited vertical clearances
- Single lane replacement
- Runway keelways
